

Installing c2html 1.0.0 bêta

This file describes how to install c2html.

At first we have to extract the c2html-package (.tar.gz file). Now there are two required steps to install c2html left:

- compiling the program;
- installing the program

Not a required, but however a recommended step, is cleaning (= removing object files and the executable) the directory where we compiled the program.

Compiling

We compile c2html by running make:

```
make
```

If you are running a system (like BSD) which uses cc instead of gcc, you should run:

```
make cc
```

And when you are using another compiler:

```
make CC=<compiler>
```

Where <compiler> is the name of the compiler you are using.

Installing

Now we can install the program (under root), by running:

```
make install
```

The program will be installed in */usr/local/c2html* and a binary in */usr/local/bin* . To install the program in a self-defined directory run:

```
make install prefix=<directory>
```

After doing this, c2html is installed in *<directory>/c2html* and a binary in *<directory>/bin* .

Cleaning

To delete the object files and executable in the current working directory, run:

```
make clean
```

Uninstalling

To remove c2html run:

```
make uninstall
```

This undoes all effects of a previous 'make install'.

When c2html is not installed in the default directory (*/usr/local*), run:

```
make uninstall prefix=<directory>
```

<directory> is the directory where c2html is installed in.
